For grass, use 350 to 400 lbs. to the acre; apply broadcast before a rain.

For vines and fruit trees of every kind, loosen the earth about the vine or tree and use at the rate of 500 lbs. to the acre, working it into the soil.

On potatoes mix the fertilizer with the earth where the seed is dropped. Use at the rate of 400 lbs. to the acre.

For corn or vegetables, use from 300 to 400 lbs. to the acre.

For hops, use from 400 to 500 lbs. to the acre.

ORGANIC AND CHEMICAL FERTILIZER.

Food for Plants, 25 Cents Per Box.

Our Organic Plant Fertilizer makes plants grow and bloom luxuriantly, and drives insects from the soil. This excellent fertilizer is the only one of the sort which can be used with good results to pot plants. It is used by dissolving a teaspoonful in a pint of water and applying to the soil of pot plants every week or two. It has no disagreeable odor, and is the only artificial fertilizer which can be used without danger of injury to the plant. It starts the plants at once into a healthy and vigorous growth and abundant bloom. It drives worms and other troublesome insects from the soil. It takes the place of liquid manure, and is just the thing that has been wanted for a long time. Especially fine for ferns and house plants and window gardening in general.

P.—PANSY (Heart’s Ease).

After careful comparative tests of the seeds of dozens of growers, home and foreign, we secured a trial from an experienced grower of Germany who has made a specialty of the pansy for many years. We have used his seeds now for six years, and found them to be all that could be claimed for the perfection in the culture of this favorite. Seeds may be sown in the open ground in spring or summer, or in hotbed very early in spring. Young plants produce the largest and best flowers. The plants should occupy a cool, partially shaded situation; the ground cannot be too rich. Coolness and moisture are necessary. Transplant when an inch high.

Organic and Chemical Fertilizer will enlarge the flowers of the pansy if used as in the direction on second page of cover.

Seulberger’s Superior Mixture shows flower quality. Packet, 25 cents.

The cob is the smallest, in comparison with the size of the ear, of any variety in cultivation, and when broken in half the grains will reach across. The richness of color and fine quality of grain make it vastly superior for grinding into meal. The grains are not of a hard, flinty nature, neither are they so soft as to be greatly shriveled. The ears are easily shelled, although the kernels are firm on the ear, and in every respect present as perfect a type as could be possible to have. The stalks take strong hold in the ground, and grow vigorously to a height of eight to nine feet. EULALIA ZEBRINA JAPONICA.
This plant is unlike most variegated plants, as its stripe or marking is across the leaf instead of lengthwise, which gives it a very peculiar but beautiful appearance. It grows from four to six feet high, and is very graceful in form. Being perfectly hardy, it is more desirable, as plants will improve in size and beauty every year. For planting on a lawn as a single specimen plant, or for grouping, it is unsurpassed. In the fall it bears large, tassel-like plumes. These may be used as parlor ornaments, and will last for years. 25 cents.

HOW TO MAKE A HANDSOME LAWN.

What Is Most Necessary Is to Have Good Seed and the Ground Thoroughly Worked.

The ground should be thoroughly cleansed of all root weeds before sowing. It should be dug to an equal depth, and trodden, rolled and leveled until a firm, uniform surface is obtained. The selection of proper grass seeds is the important matter, and this requires more than ordinary attention, so that the kinds of grass be suited both to the purpose and soil. It must be remembered that much of the fine appearance of a lawn depends upon regularity in mowing.

For forming new lawns fifty or sixty pounds of seed are required per acre, and for renovation of old lawns half that quantity will give good results.

LAWN FERTILIZER.

Unless thoroughly decomposed, stable manure is not desirable because of the number of weed seeds contained in it. Our Bone Meal fertilizer possesses the requisite properties to induce a rapid, luxuriant growth, and should be sown broadcast at the rate of 400 pounds per acre.
